Docket No. (05:153)

Applicant: Mihara KIYOO

Preliminary Amdt.

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the

application:

Listing of Claims:

Claims 1-4. (Canceled)

5. (New) A valve mechanism to be attached to a tightly closed bag for holding its contents

by keeping the contents from the ambient air and adapted to open for evacuating air from the

tightly closed bag and close for stopping such evacuation, the valve mechanism comprising:

a suction connector mounted on the outer surface of a tightly closed bag having a hole formed

therein, the suction connector having a vent formed in its center and being so shaped as not to

form any projection on the outer side of the tightly closed bag; a valve base mounted on the

inner surface of the tightly closed bag and having a recessed shape in cross-section, a suction

opening formed in its center as viewed in top plan and an edge portion adapted to be joined to

the suction connector with the tightly closed bag held therebetween; and a valve body facing

the suction opening within the valve base and adapted to open the suction opening upon

suction through the vent and close it upon stoppage of the suction.

6. (New) The valve mechanism according to claim 5, wherein the valve base has a ring

member of an elastic material attached integrally to it, and the suction connector has a

Preliminary Amdt.

concavity formed in its portion corresponding in position to the ring member on the valve

base.

7. (New) The valve mechanism according to claim 5, wherein the valve base has ridges

formed on the opposite side thereof from the suction connector and extending from the

periphery of a suction opening.

8. (New) The valve mechanism according to claim 6, wherein the valve base has ridges

formed on the opposite side thereof from the suction connector and extending from the

periphery of a suction opening.

9. (New) The valve mechanism according to claim 5, wherein the suction connector further

comprises load restraining means provided around its vent for restraining the load of the

suction device used for discharging air from the tightly closed bag.

10. (New) The valve mechanism according to claim 6, wherein the suction connector further

comprises load restraining means provided around its vent for restraining the load of the

suction device used for discharging air from the tightly closed bag.

11. (New) The valve mechanism according to claim 7, wherein the suction connector further

comprises load restraining means provided around its vent for restraining the load of the

suction device used for discharging air from the tightly closed bag.

Preliminary Amdt.

12. (New) The valve mechanism according to claim 8, wherein the suction connector further

comprises load restraining means provided around its vent for restraining the load of the

suction device used for discharging air from the tightly closed bag.

13. (New) The valve mechanism according to claim 6, wherein the ring member is

dementioned to fit into the concavity with a portion of the bag around the periphery of an

opening in one wall retained in air-tight relation therebetween.

14. (New) The valve mechanism according to claim 7, wherein the ring member is

dementioned to fit into the concavity with a portion of the bag around the periphery of an

opening in one wall retained in air-tight relation therebetween.

15. (New) The valve mechanism according to claim 9, wherein the ring member is

dementioned to fit into the concavity with a portion of the bag around the periphery of an

opening in one wall retained in air-tight relation therebetween.
